

ABSTRACT OF THE DISCLOSURE

An electronic service system is formed by a main site server system and a partner site server system. The main site server system carries out a remote updating of contents of tie-up pages at the partner site server system, when the authentication between the main site server system and the partner site server system succeeds. The partner site server system maintains tie-up pages related to a partnership between the main site and the partner site, and original pages of the partner site.
